Xeva Tutorial

Arvind Mer

2018-06-18

Load Xeva library and KRAS/P53 PDX data

```
library(Xeva)
data(lpdx)
```

To see all the model.id

```
lpdx.mod = modelInfo(lpdx)
head(lpdx.mod$model.id)
```

```
## [1] "PHLC1106_P5.501.A1" "PHLC1106_P5.504.A4" "PHLC1106_P5.506.B1"
## [4] "PHLC1106_P5.507.B2" "PHLC1106_P5.508.B3" "PHLC1106_P5.511.C1"
```

To get the data for one model.id

```
modId = lpdx.mod$model.id[82]
df = getExperiment(lpdx, model.id = modId)
head(df)
```

```
##             model.id         drug.join.name time    volume width length

```

In the data.fram df you will see that for first 3 time points dose is 0, which indicate no treatment is given during this time. If you want the data only during the treatment periode specify treatment.only = TRUE

```
df = getExperiment(lpdx, modId, treatment.only = TRUE)
head(df)
```

```
##             model.id         drug.join.name time   volume width length dose

```

Models which are replicates are stored togather in expDesign slot. To get the data for all the replicates pass the ‘batch.name’ in the getExperiment function.

```
print(batchNames(lpdx))
```

```
##  [1] "PHLC1106_P5" "PHLC111_P7"  "PHLC119_P5"  "PHLC153_P6"  "PHLC181_P7"

## 12      22.762 2014-12-19            <NA>     133.84935         66.59005
## 13      22.458 2014-12-23            <NA>     168.31857         74.41532
##    volume.normal exp.type
## 8     0.00000000  control
## 9     0.06713144  control
## 10    0.07184083  control
## 11    0.11271078  control
## 12    0.22283598  control
## 13    0.40308110  control
```

Here the data.fram contaions an extra column ‘exp.type’ . This indicates if this is treatment or control.

To calculate angle between the treatment and control samples of this batch

```r
batchNames <- batchNames(lpdx)
expDesign  <- expDesign(lpdx, batchNames[1])
#ang <- calculateAngle(lpdx, expDesign, treatment.only = TRUE, plot=TRUE)
#print(ang)

#for(I in batchNames)
#{
#  expDesign  <- expDesign(lpdx, I)
#  ang <- calculateAngle(lpdx, expDesign, treatment.only = TRUE, plot=TRUE)
#  print(ang)
#}
```

Summarize Response of PDXs Get slop of each model and combine summarize all model slop which belongs to same patient by "mean"

```r
#lpdx_slop <- summarizeResponse(lpdx, response.measure = "slop",
#                               group.by="patient.id", summary.stat = "mean")
```

Get angle between treatment and control model ids. For each batch it will give one angle value

```r
#lpdx_angle <- summarizeResponse(lpdx, response.measure = "angle")
```

Get mutation expression profile

```r
ldxe_mut <- getMolecularProfiles(lpdx, data.type="mutation")
print(ldxe_mut)
```

```
## ExpressionSet (storageMode: lockedEnvironment)
## assayData: 16116 features, 12 samples
##   element names: exprs

```

The sample names in expression set are called biobase.id in model slot. Sample names from the expression set canb be be mapped to individual PDX model.ids as

```r
# get sample names
library(Biobase)
```

```
## Loading required package: BiocGenerics

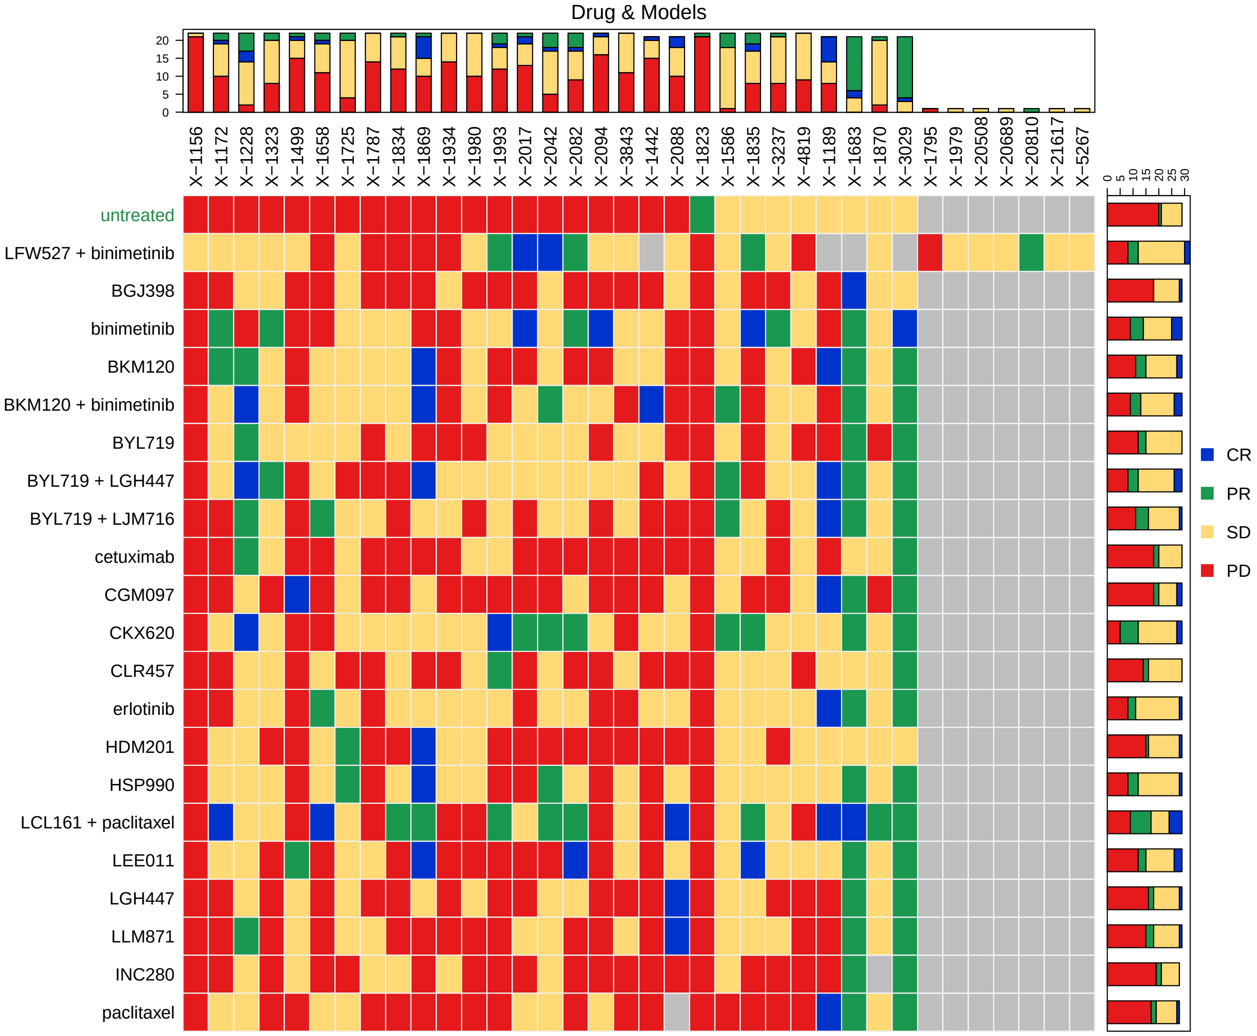
## PHLC1106_P5.511.C1   PHLC1106 PHLC1106_P5.511.C1
```

What should we do here

```
df = getExperiment(lpdx, "PHLC119_P5.506.B1")
#print(df[df$time>85 & df$time<109, c("time", "width", "length", "volume", "comment", "dose")])
```

Create mRECIST plot for PDXE Lung Cancer data

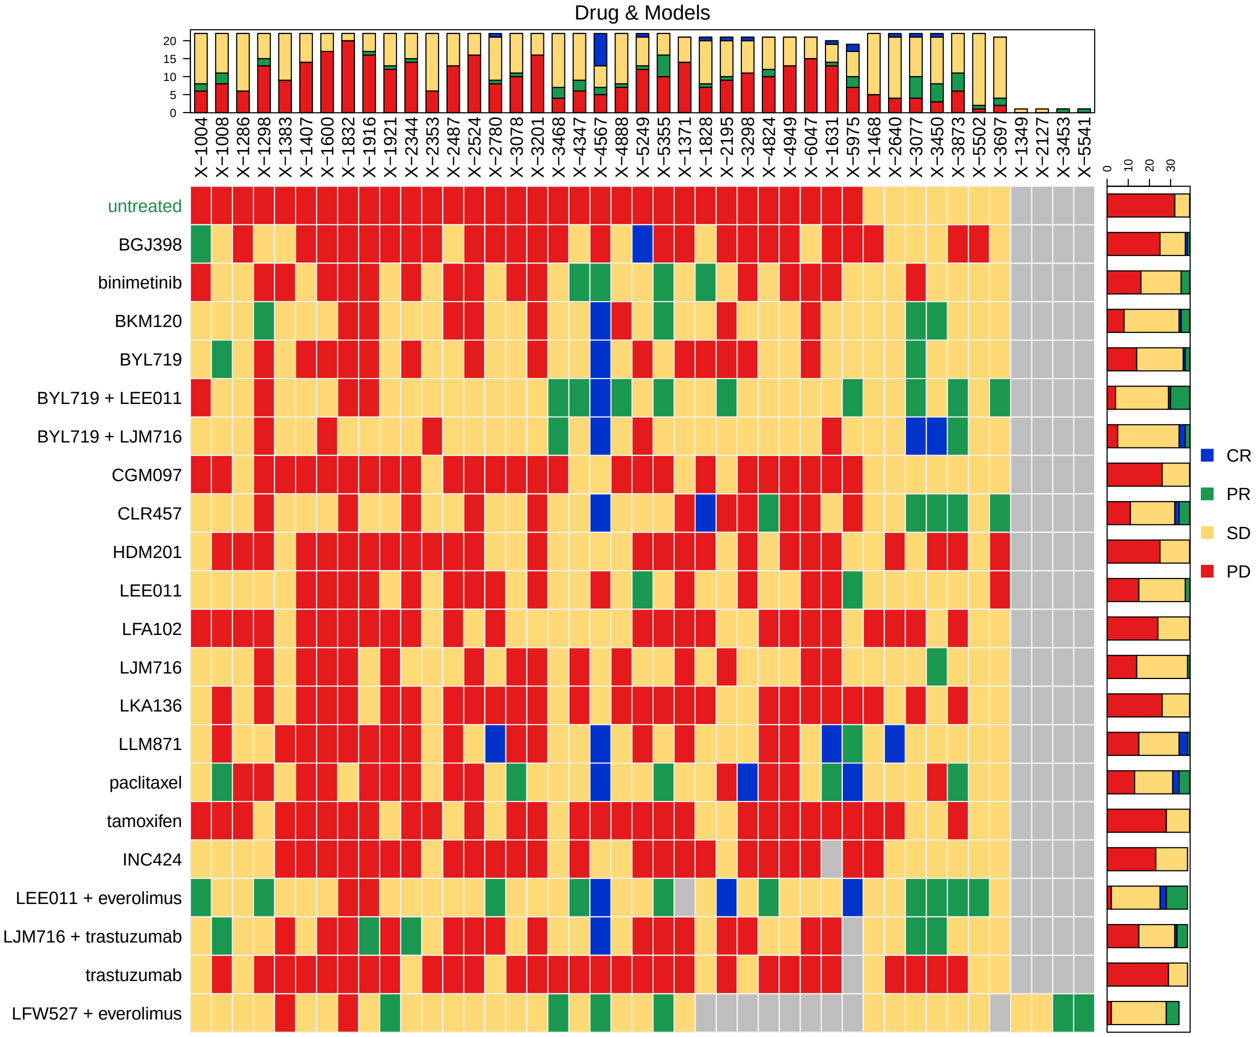
```
#data(pdxe)
load("~/CXP/XG/Gao2015_Xeva_DataProcess/pdxe.rda")
#select lung cancer PDXE data
pdxe.lung <- summarizeResponse(pdxe, response.measure = "mRECIST",
                               group.by="patient.id", tumor.type="NSCLC")
## plot matrix
plotmRECIST(pdxe.lung, control.name = "untreated")
```



Create mRECIST plot for PDXE Breast Cancer data

```
#data(pdxe)
#select lung cancer PDXE data
pdxe.brca <- summarizeResponse(pdxe, response.measure = "mRECIST",
                               group.by="patient.id", tumor.type="BRCA")

## plot matrix
plotmRECIST(pdxe.brca, control.name = "untreated", control.col = "#238b45")
```



Creat mR vs slop bar-plot

```
#data(pdxe)

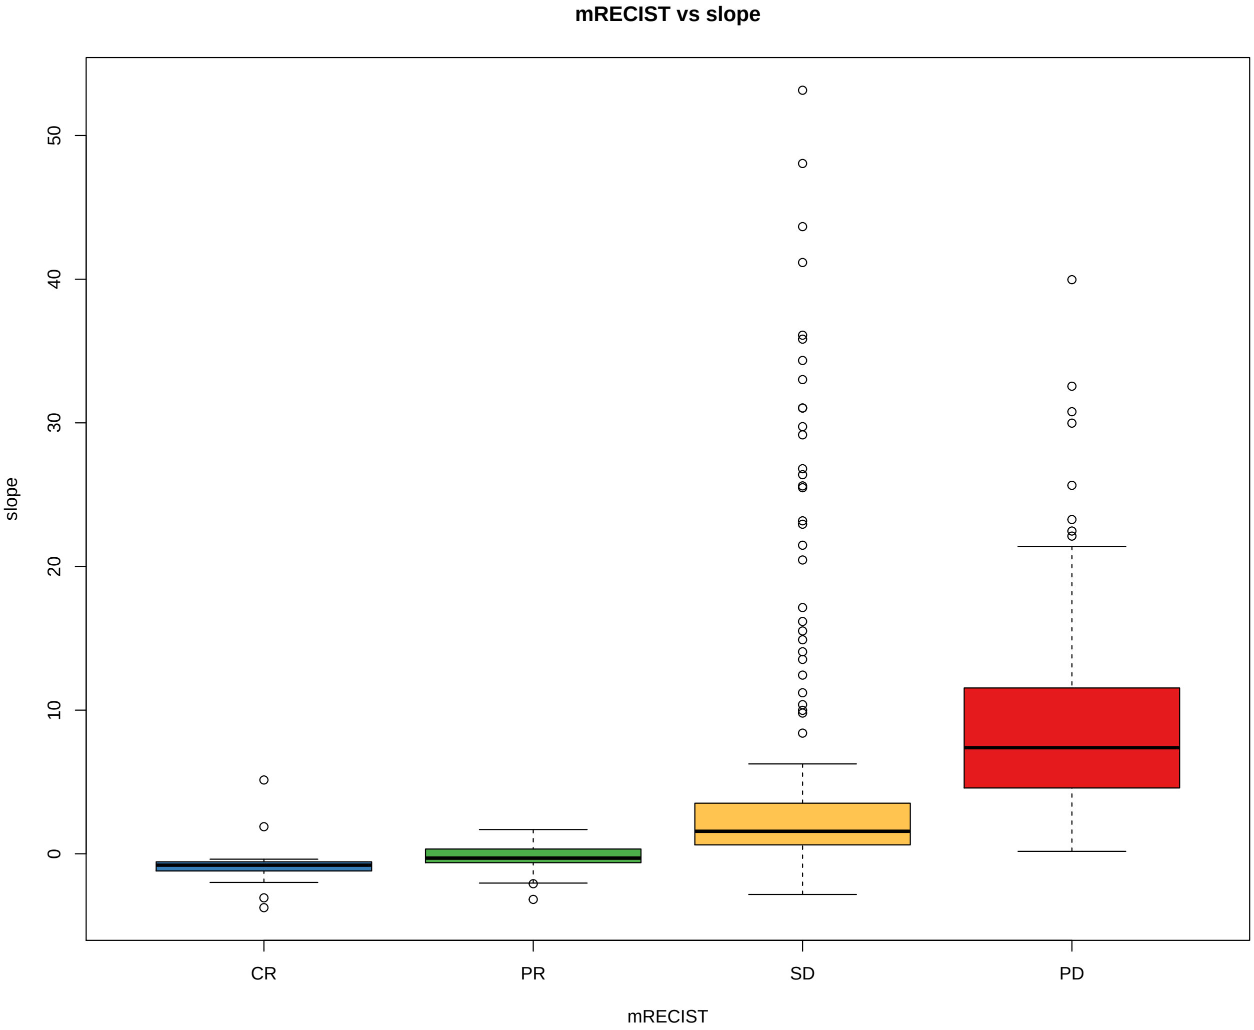
lung_pdxe_slope <- summarizeResponse(pdxe, response.measure = "slope", group.by="patient.id",
                                     summary.stat = "mean", tumor.type = "NSCLC")

lung_pdxe_mR <- summarizeResponse(pdxe, response.measure = "mRECIST",
                             group.by="patient.id", tumor.type="NSCLC")

slope=c(); mR=c()
for(dn in rownames(lung_pdxe_slope))
{
  for(pi in colnames(lung_pdxe_slope))
  {
    v = c(lung_pdxe_slope[dn,pi], lung_pdxe_mR[dn,pi])
    if(!is.na(v[1]) & !is.na(v[1]))
    { slope = c(slope,v[1]); mR=c(mR,v[2]) }
  }
}
```

```
df = data.frame(mR= mR, slope= as.numeric(slope), stringsAsFactors = FALSE)
df$mR= factor(df$mR, c("CR", "PR", "SD", "PD"))

colPalette = c("#377eb8", "#4daf4a", "#fec44f", "#e41a1c")
boxplot(slope~mR, data=df, col=colPalette, main="mRECIST vs slope",
        xlab="mRECIST", ylab="slope")
```



Get genomic data and response for a drug summarizeMolecularProfiles gives an expression-set with sensitivity.

```
pacRNA <- summarizeMolecularProfiles(pdxe, drug="paclitaxel", mDataType="RNASeq",
                                     tumor.type= "BRCA", sensitivity.measure="mRECIST")
print(pacRNA)
```

```
